

## INTRODUCTION

Architecturally, JSP may be viewed as a high-level abstraction of Java servlets. JSP pages are loaded in the server and are operated from a structured special installed Java server packet called a Java EE Web Application, often packaged as a .war or .ear file archive.

JSP allows Java code and certain pre-defined actions to be interleaved with static web markup content, with the resulting page being compiled and executed on the server to deliver an HTML or XML document. The compiled pages and any dependent Java libraries use Java bytecode rather than a native software format, and must therefore be executed within a Java virtual machine (JVM) that integrates with the host operating system to provide an abstract platform-neutral environment.

JSP syntax is a fluid mix of two basic content forms: scriptlet elements and markup. Markup is typically standard HTML or XML, while scriptlet elements are delimited blocks of Java code which may be intermixed with the markup. When the page is requested the Java code is executed and its output is added, in situ, with the surrounding markup to create the final page. JSP pages must be compiled to Java bytecode classes before they can be executed, but such compilation is needed only when a change to the source JSP file has occurred.

Java code is not required to be complete (self contained) within its scriptlet element block, but can straddle markup content providing the page as a whole is syntactically correct (for example, any Java if/for/while blocks opened in one scriptlet element must be correctly closed in a later element for the page to successfully compile). This system of split inline coding sections is called step over scripting because it can wrap around the static markup by stepping over it. Markup which falls inside a split block of code is subject to that code, so markup inside an if block will only appear in the output when the if condition evaluates to true; likewise markup inside a loop construct may appear multiple times in the output depending upon how many times the loop body runs.

The JSP syntax adds additional XML-like tags, called JSP actions, to invoke built-in functionality. Additionally, the technology allows for the creation of JSP tag libraries that act as extensions to the standard HTML or XML tags. JVM operated tag libraries provide a platform independent way of extending the capabilities of a web server. Note that not all commercial Java servers are Java EE specification compliant.

**MySQL** is a relational database management system (RDBMS)<sup>[2]</sup> that runs as a server providing multi-user access to a number of databases. The SQL phrase stands for Structured Query Language.

The software components used in our project are as under:

1. Eclipse
2. MySQL database

## **OVERVIEW**

The importance of placement system is increasing day by day. Thousands of applicants are depending placement cell. But the applicants are facing so many problems. This project is an attempt to minimize the problems of an applicant to find a correct job. If we can make it an online computerized and a mobile alert process it will be so fast and convenient for the applicants. Far from upsetting matters, however, new technologies have predominantly made life better and considerably easier for most people, and so it must be concluded that they should be welcomed.

Software does not require a dedicated computer and can be run on almost any PC running Windows OS. The package includes the MOB JOBS software and a normal cell phone and data cable. It uses a normal SIM card from a GSM operator with a local mobile number. In functionality it is similar to the four digit short codes but unlike short codes that is billed according to the agreement between the content provider and the service provider and can only be reached from certain networks a long code (Local GSM number) can be accessed from almost anywhere in the world for the price of a Normal SMS depending on location and tariff of the Local GSM operator. Receiving the response is an incoming SMS and is free.

## **EXISTING SYSTEM**

The existing system is a manual system of limitations like accuracy, expense, low speed and efficiency and unformatted outputs. In the existing system, all data processing is done manually. All the files and record books are replaced by the software system. When there are a lot of issues such as retrieval and storage of the information and keeping track of them becomes a tedious task. By implementing a computerized system, the limitation in the present system will be reduced. Manpower can be reduced to a great extent and efficiency and accuracy can be increased to manifold. More over consumption of time can be reduced to far greater extend by the implementation of the proposed system.

## **PROPOSED SYSTEM**

In the proposed system we propose to computerize the above-mentioned activities. In the existing system, all data processing is done manually. When there are a lot of issues such as retrieval and storage of the information and keeping track of them becomes a tedious task. By implementing a computerized system, the limitation in the present system will be

---

reduced. Manpower can be reduced to a great extent and efficiency and accuracy can be increased to manifold. More over consumption of time can be reduced to far greater extend by the implementation of the proposed system.

The proposed computer based information system is aimed at eliminating the limitations of the existing system via increasing speed of information retrieval, by increasing processing speed, data security and hence give accurate reports. The proposed system fully satisfies user needs. All most all the limitations of the existing system are reduced in a great manner. Details are stored in various files from which data can be accessed and manipulated easily.

In the proposed system there are two sections one is administration part in which the following processes are carried out.

## MERITS OF PROPOSED SYSTEM

- A lot of manual work which is time consuming and tedious can be reduced.
- Eliminates wrong entries and hence give accurate report.
- Reduce paper work and extra cost.
- Data redundancy can be avoided.
- Data security.
- Information retrieval is faster.
- User friendliness.
- Flexibility.
- The number of registers can be reduced.
- The new system provides data consistency and integrity so that data at any time represent the current status.
- The system should provide better security and control over data.

## MODULE DESCRIPTION

- 1). Applicant registration
- 2). Company registration
- 3). Job search

4). Vacancy Registration

5). Message

**1) Applicant registration:**

The applicant can register into the site by providing his details and he can set his username and password for logging in later.

**2) Company registration:**

The authority of the company can register into the site by providing its details and they can set its username and password for logging in. They can also specify their requirements for each vacancy.

**3) Job search:**

Applicants can search for the job vacancies in the fields of their choice and apply as interested.

**4) Vacancy registration:**

Authority of the company can provide all the necessary information about the vacancies in each post along with eligibility criteria.

**5) Message:**

Software selects the apt ones from the registered applicants for each post and informs them by a mobile alert. The message includes interview details.

## **SYSTEM SPECIFICATION**

### **HARDWARE REQUIREMENTS**

#### **Minimum Requirements**

Processors : Intel Pentium Pro or Processor running at 133 MHz

Hard Disk : 1.2 GB Hard Disk

RAM : Client Level – Minimum 128MB

#### **Recommended Requirements for peak performance**

Processors : Intel Pentium III running at 450 MHz

RAM : Client Level – Minimum 512MB

Display Type: SVGA Color Monitor

Keyboard : Enhanced 104 Standard

Mouse : PS/2 2 Button

### **SOFTWARE REQUIREMENTS**

**Operating System :** WINDOWS 2000/2003/

XP/WINDOWS 7/WINDOWS VISTA

### **TOOLS USED:**

**Front end:** ECLIPSE

**Back end:** MYSQL ,TOMCAT SERVER

# **E-R DIAGRAM**

## TABLE STRUCTURES

The structure of all tables included in the project is as under:-

### **1. INTERVIEW**

| Field     | Type        | Null | Key | Default | Extra |
|-----------|-------------|------|-----|---------|-------|
| can_uname | varchar(50) | YES  | MUL | NULL    |       |
| com_name  | varchar(50) | YES  | MUL | NULL    |       |
| iv_date   | date        | YES  |     | NULL    |       |
| iv_time   | varchar(20) | YES  |     | NULL    |       |
| iv_place  | varchar(50) | YES  |     | NULL    |       |

### **2. EMPLOYER**

| Field    | Type        | Null | Key | Default | Extra |
|----------|-------------|------|-----|---------|-------|
| emp_name | varchar(50) | NO   | PRI |         |       |
| emp_pass | varchar(50) | YES  |     | NULL    |       |
| emp_web  | varchar(50) | YES  |     | NULL    |       |

### 3.APPLICANT

| Field    | Type        | Null | Key | Default | Extra |
|----------|-------------|------|-----|---------|-------|
| fname    | varchar(50) | NO   |     | NULL    |       |
| lname    | varchar(50) | NO   |     | NULL    |       |
| gender   | varchar(10) | NO   |     | NULL    |       |
| username | varchar(50) | NO   | PRI | NULL    |       |
| password | varchar(50) | NO   |     | NULL    |       |
| email    | varchar(50) | NO   |     | NULL    |       |

### 4.JOB

mysql> desc job;

| Field    | Type        | Null | Key | Default | Extra |
|----------|-------------|------|-----|---------|-------|
| c_name   | varchar(50) | NO   | PRI |         |       |
| c_web    | varchar(50) | YES  |     | NULL    |       |
| vacancy  | int(50)     | YES  |     | NULL    |       |
| salary   | int(50)     | YES  |     | NULL    |       |
| job_desc | varchar(50) | YES  |     | NULL    |       |
| location | varchar(50) | YES  |     | NULL    |       |
| sel_post | varchar(50) | YES  |     | NULL    |       |
| iv_date  | date        | YES  |     | NULL    |       |
| iv_time  | varchar(20) | YES  |     | NULL    |       |
| iv_place | varchar(50) | YES  |     | NULL    |       |

Done

1:55 PM  
4/20/2011

The screenshot shows a Java web application running in an Eclipse Platform interface. The main window title is 'Java - http://localhost:8080/mainp/1.jsp'. The menu bar includes File, Edit, Navigate, Search, Project, Run, Window, and Help. A toolbar with various icons is visible above the tabs. The tabs at the top include LOGIN\_A.jsp, 1.jsp, app\_home.jsp, emp\_reg.jsp, login\_e.jsp, interview.jsp, home1.jsp, and APPLICANT LOGIN PAGE. The current tab is 'APPLICANT LOGIN PAGE'. Below the tabs, the URL 'http://localhost:8080/mainp/1.jsp' is displayed. The main content area has a light blue background and contains a heading 'Candidate Information Page :'. A note 'Required fields' is preceded by an asterisk. There are three main sections: 'Login Information' (with fields for Email address, First name, Last name, Desired username, Password, and Re-enter password), 'Personal Details' (with a Gender section containing 'Male' and 'Female' radio buttons), and 'Professional Details' (with a 'Total experience' field using dropdown menus for years and months). The bottom of the window shows a toolbar with icons for Windows, Internet Explorer, Firefox, and other applications, along with system status information like '1:55 PM' and '4/20/2011'.

## **FUTURE SCOPE**

There have been numerous cases of computer glitches, errors in content, and security lapses reported in online job searching .So in the near future the so –called software could be made more secure and reliable.While electronic glitches are rare, they have been known to occur, for instance when computer crashes voided the efforts of thousands of student. There are also cases in which the correction software has corrupted databas. so the software can be programmed well so as to avoid corrupted information

.....

## **CONCLUSION**

The Online job portal System is developed using java and sql fully meets the objectives of the system for which it has been developed. The system is operated at a high level of efficiency and all the job seekers and user associated with the system understands its advantage. The system solves the problem. It was intended to solve as requirement specification.
